

# Synth-A-Scope Module

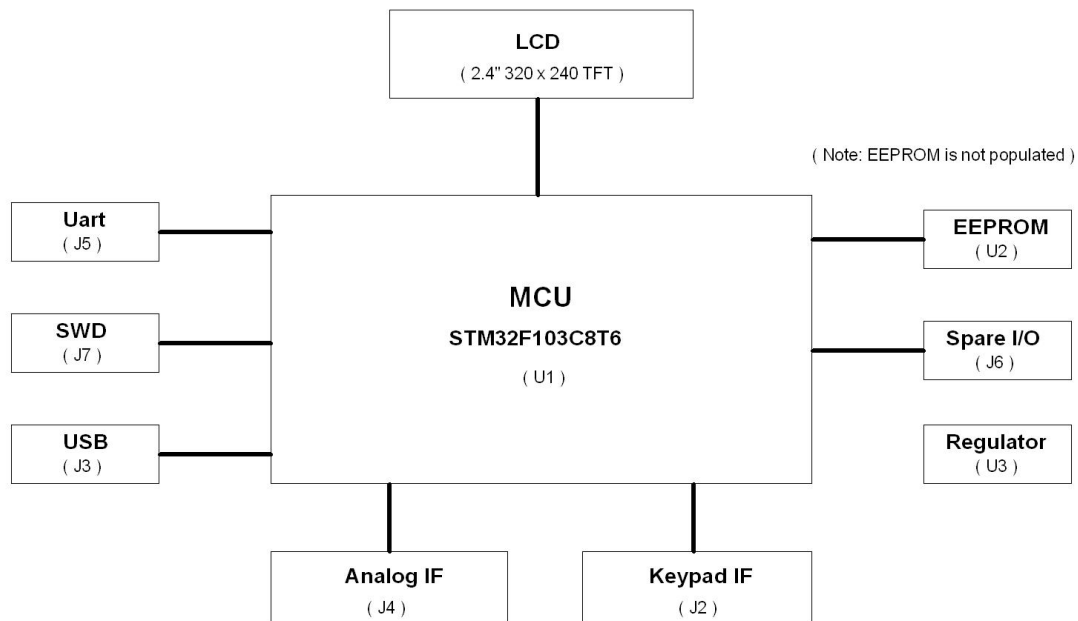

## Summary

The Synth-A-Scope Module single-channel oscilloscope controller is based on ARM Cortex-M3 micro-controller STM32F103C8T6 from ST and consists of an on-board 2.4" 320x240 TFT LCD display, analog interface, and keypad interface. UART, USB, and spare I/O ports are also provided for possible expansion (these ports have no function as of current firmware).

The Synth-A-Scope Module oscilloscope controller uses +5V from the keypad interface (J2) as power supply.

SWD (Single Wire Debugger) port (J3) is for programming the micro-controller U1.

Alternatively, the micro-controller can also be programmed via the UART port.

## Interfaces

### Analog Interface

Pin	Signal Name	Dir	Function
1	VSENSEL1	In	Position detect of sensitivity selection switch 1
2	ADCIN	In	ADC input (from analog channel)
3	VSENSEL2	In	Position detect of sensitivity selection switch 2
4	TL_PWM	Out	PWM signal for trigger level generation
5	CPLSEL	In	Position detect of couple switch
6	TRIG	In	Trigger signal
7	GND	-	Ground
8	GND	-	Ground

### Keypad Interface

Pin	Signal Name	Dir	Function
1	BTN2	In	Button 2 detection
2	BTN1	In	Button 1 detection
3	BTN4	In	Button 4 detection
4	BTN3	In	Button 3 detection
5	LED	Out	Driving LED
6	NC	-	No connection
7	+5V	-	+5V power supply input
8	+5V	-	+5V power supply input
9	GND	-	Ground
10	GND	-	Ground

# Synth-A-Scope Module

## Specifications

### Electrical

Parameters	Values	Remarks
Power supply voltage	4.5V --- 7V	
Power supply current	70mA (typical)	
Low level input voltage	1.1V (max)	For digital input pins except BTN[1:4]
High level input voltage	2.2V (min)	For digital input pins except BTN[1:4]
Low level input voltage	0.8V (max)	For BTN[1:4]
High level input voltage	2.0V (min)	For BTN[1:4]
Output low level voltage	0.4V (max)	At 8mA current
Output high level voltage	2.9V (min)	At 8mA current
ADC input voltage range	0V – 3.3V	

### General

Parameters	Values
Real-time sampling rate	1MSPS (max)
Sensitivity	10mV/div – 5V/div (in “1-2-5” steps)
Timebase	10us/div – 500s/div (in “1-2-5” steps)
Capture buffer size	1024 bytes
Trigger modes	Auto/Norm/Single
Display size	2.4”
Display resolution	320 x 240

# Synth-A-Scope Module

## Application Information

### Power Supply

Power is supplied through connector J2. It should be in the range 4.5V to 7V

### Connection to Analog Channel

The connector J4 is for connecting to the analog channel. The [schematic](#) shows a typical analog channel and how it is connected to the analog interface of the Synth-A-Scope Module.

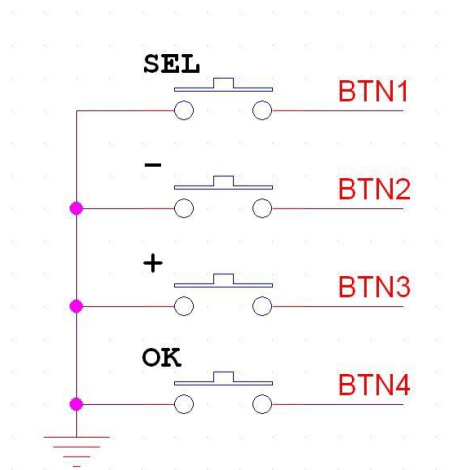

The signals CPLSEL, VSENSEL1, and VSENSEL2 are used to detecting switch position by measuring the voltage generated by a resistor divider that relates to switch setting.

The signal TL\_PWM is fed to a low-pass filter to extract its DC component and used as trigger level input to a comparator.

ADCIN is the output of analog channel. The comparator compares analog output with the trigger level and produces trigger signal TRIG.

### Button Connections

The connector J2 is for connecting to operation buttons.

*Illustrating the typical connections for buttons.*

# Synth-A-Scope Module

## Operations

### 1) Basic operations

- Select the parameter to be adjusted by pressing the [SEL] button. The selected parameter will be highlighted.
- Use [+] or [-] buttons to change the selected parameter to the value you want.
- Pressing the [OK] button will make the scope enter HOLD state and freeze the displayed waveform. Pressing the same button again will de-freeze display and scope returns to normal state.

### 2) Advanced operations

Functions	Operations
<b>VPos Alignment</b>	Set Couple Switch to GND position. Push SEL to highlight vertical position indicator and hold down OK button for about 3 seconds.
<b>Measurements ON/OFF</b>	Push SEL to highlight timebase and hold down [OK] button for about 3 seconds. This will turn ON or OFF on-screen display of measurements including Vmax, Vmin, Vavr, Vpp, Vrms, Freq., Cycle, Pulse width, and Duty cycle.
<b>Save Waveform</b>	Press SEL & + simultaneously to save currently displayed waveform to EEPROM. The existing data in EEPROM will be over-written.
<b>Recall Waveform</b>	Press SEL & - simultaneously to display saved waveform. Recalled waveform is always displayed in Hold state.
<b>Default Restore</b>	Hold down + and - buttons simultaneously for about 3 seconds to restore factory default settings.
<b>Center HPos</b>	Push SEL to highlight horizontal position indicator and hold down OK button for about 3 seconds. This will make the center portion of waveform displayed.
<b>Center Trigger Level</b>	Push SEL to highlight trigger level indicator and hold down OK button for about 3 seconds. This will set the trigger level to the medium value of current signal amplitude.
